Pave the way for Nordic cooperation on soil as a carbon sink

To reap the benefits from carbon sequestration in soil it is essential to calculate and communicate the effects of different carbon capture activities. In this film we look into different methods and models on how to calculate and communicate these activities. The use of same methods and terminology makes co-operation easier.

This film, the third out of four, is based on the outcomes of a seminar on visualisation methods and models for soil carbon storage, initiated and

financed by Nordic Forest Research, Nordic Agri Research and the Nordic Council of Ministers.

It's not too late – we recorded the whole thing!

Join a four day workshop on "Dialogue on governance to develop sustainable forest landscapes for production of wood for energy and the bioeconomy".

We recorded the workshop for you to watch whenever it suits you! Opportunities and challenges in managing forests in a sustainable manner were discussed, as were various types of governance systems and their usefulness and feasibility for different types of forest owners and actors.
